

# Mediweb

## Sprint Retrospective

### What went well

- I was able to deliver the sign-in feature
- I was able to connect the website with the Firebase database
- I was able to deliver the front-end for the sign-in and sign-up screens
- I was able to push patient data from the website into the database
- Front-end for the medi-predict interface is ready

### What went badly

- The sign-up functionality is still not working
- Front-end for the medi-predict interface is still not implemented
- Front-end for the user profiling interface is still not ready
- Front-end for the user data aggregation interface is still not ready

### Ideas for improvement

- Be more proactive with communication on issues that stay open for a while
- Instead of focusing on delivery of a whole feature in one take, divide it into small tasks to make the delivery process more manageable
-
