

Mediweb

Sprint 2 Retrospective

What went well

- I was able to integrate the sign-in and sign-up with the firebase database
- I was able to make the 'Your Profiles' page to only display a list of patients of doctor who's currently signed in
- I was able to 'Aggregate Patients Data' page to generate a CSV file
- I was able to push newly generated reports into the firebase database
- I was able to get the patient risk profile reports from the database

What went badly

- The see more patient details functionality is still not working
- Sign-in mode still has some flaws
- Aggregate data aggregates only a sample report
- Mediweb is still not integrated with the API

Ideas for improvement

- Focus more on cooperation with a person who's in charge of delivering a Medi API
- Focus more on the front-end side to make the web more visually appealing
- Plan and run multiple test cases to test the website functionalities
- Focus more on the web security and look for security flaws to make the website safer for the data flow
